

CNAI Track : Guidelines for Short Internship

As in other CogSUP tracks, the CNAI track offers the possibility of accomplishing a short internship over 12 weeks with the following formats

- half a day per week (3 ECTS, defense for validation),
- a day per week (6 ECTS, defense for validation),
- and, in exceptionally justified circumstances, two days per week (12 ECTS, short manuscript + defense for validation).

The format and the internship topic must be validated by one of the track directors. It is possible to do such an internship outside academia as far as the work concerns a research question related to neurosciences, cognitive sciences or artificial intelligence.

To validate the ECTS you need to write a short abstract (2 pages, see template files) and defend your work in front a jury (usually your track directors). The abstract must be transmitted to your track directors one week prior to the defense.

Manuscript/Abstract Guideline

Regular 3/6 ECTS internship The abstract must be written by following the guidelines given for the defense (without the section *Organization/Lab and Internship Context*). The maximum length of the manuscript is 2 pages (see template). The manuscript must be sent to the track directors in pdf format one week before the defense.

Exceptional 12 ECTS internship The manuscript must be written by following the guidelines given for the defense. The maximum length of the manuscript is increased to 5 pages (see template). The manuscript must be sent to the track directors in pdf format one week before the defense.

Defense Guidelines

The defense format is 10 minutes of presentations + 10 minutes of questions in front of the track directors or other professors from CogSUP whenever required.

General Advises for a Slide Presentation A rule of thumb for slide presentation is to assume that a slide should be displayed for at least one minute. Of course, there are exceptions, especially for introductory slides which present illustrations that are straightforward to understand and for conclusion and reference slides which will remain displayed during questions. A slide should never contain too much text and long sentences, nor too many equations. An equation is often a lot of information and should be explained carefully by giving some intuition about it using figures.

Organization/Lab and Internship Context Briefly describe the organization or lab and the global context of the internship.

Research Question and Objectives Introduce the research question and specify the main goals of the internship (within the short timeframe) and the tasks you set out to accomplish.

Methods and Tools Describe the methods, software, and/or tools (computational, experimental, ...) used to tackle your objectives.

Results Summarize key findings or progress, focusing on concrete achievements (new results or reproduction of existing results).

Discussion, Conclusion and Perspectives Summarize the main takeaways and contributions of the internship. Propose future directions and/or improvements. Mention any soft or technical skills learned or enhanced.
